The Mitsunobu reaction typically proceeds with inversion of configuration at the hydroxyl center. However, with a series of hindered alcohols, the intramolecular version of the Mitsunobu reaction afforded exclusively the product of retention of configuration. A mechanistic rationale for this observation is discussed, wherein this atypical stereochemical outcome is attributed to steric congestion at the reaction center.

### Introduction

During the studies directed toward the total synthesis of tirandamycin A<sup>1-3</sup> and B<sup>4</sup> and the pheromone of the male swift moth Hepialus hecta L,5 it was demonstrated that the 2,6-dioxabicyclo[3.3.1]nonane ring system of these natural products, e.g., 5, could be synthesized by peracid oxidation of anti-furfuryl alcohol derivative 1b and subsequent acid-catalyzed ketalization of the resulting pyranone 2b (Scheme 1). To our surprise, oxidation and acid treatment of the diastereomeric syn-alcohol 1a afforded bicyclic lactone 3a, rather than the anticipated diastereomeric ketal, via a novel acid-catalyzed rearrangement of pyranone intermediate 2a.1 This rearrangement was remarkable since both furfuryl alcohol 1a and its diastereomer 1b underwent oxidation-rearrangement in a completely stereoselective manner to yield a single product, lactone **3a**. 1,5

We previously reported¹ that the rearrangement described above is general for furfuryl analogues and appears to possess potential as an approach to the stereoselective synthesis of acyclic 1,3,5-triol derivatives (Scheme 2).6 The synthetically challenging 1,3,5-triol moiety occurs in a variety of biologically important natural products, most notably the macrolide antibiotics erythromycin A,7 rifamycin S,8 lankamycin,9 roflamycoin,¹0 and streptovaricin A.¹¹ Because lactone **3b** could not be prepared by the rearrangement methodology (see Scheme 1), Mitsunobu inversion was investigated as a method for preparing triol **6b** via the corresponding lactone **3b**. The Mitsunobu reaction has been widely utilized in organic synthesis, most notably as a means

of inverting stereochemistry at a secondary hydroxyl moiety. 12-15 In this paper, we report that the intramolecular Mitsunobu reaction of **3a** and structurally related bicyclic lactone analogues occurred with either retention or inversion of configuration depending on the steric environment of the secondary hydroxyl group. These remarkable results provided insight into the mechanism of the Mitsunobu reaction.

### **Results and Discussion**

The hemiketal functionality of bicyclic lactone **3a** was protected as the methyl ether (*p*-TsOH, MeOH, rt), producing compound **7a** in high yield (Scheme 3). Subsequently, lactone **7a** was hydrolyzed with NaOH and

### Scheme 1

then treated with *p*-TsOH to form hydroxyacid **8** in situ. As anticipated from the accepted mechanism of the Mitsunobu reaction, hydroxyacid 8 underwent stereospecific relactonization with inversion of configuration to provide bicyclic lactone 7b. The relative stereochemistry of lactone 7b was verified by 1H and 13C NMR spectroscopy. No trace of lactone 7a was observed in the crude product.

96%

To determine the generality of the intramolecular Mitsunobu inversion, the Mitsunobu reaction of lactones 10a and 13a was investigated (Scheme 4). The hydroxyl function at C-6 is more sterically hindered in these derivatives, and the effect of this steric factor on the lactonization process was unknown. Bicyclic lactones 10a and 13a were prepared from lactones 9 and 12, respectively. Hydrolysis of lactones 10a and 13a with NaOH, followed by acidification gave hydroxyacids 11 and 14, respectively. However, under the conditions of the Mitsunobu reaction (PPh<sub>3</sub>, DEAD, buffer solution, pH ~6), <sup>16,17</sup> both systems yielded only starting lactone, the product of retention of stereochemistry, rather than the inverted diastereomers 10b and 13b. This unexpected stereochemical result indicated that steric bulk adjacent to the C-6 reaction center influenced whether retention or inversion of configuration was observed in the Mitsunobu lactonization.

# Scheme 4

# Scheme 5

The generality of the hydrolysis-Mitsunobu lactonization process was investigated also with highly hindered lactone **16a** (Scheme 5). As expected on the basis of the results from lactones **10a** and **13a** (Scheme 4), complete retention of configuration was observed for relactonization of hydroxyacid **17** as summarized in Scheme 5.

Retention of configuration in the Mitsunobu reaction has been reported previously.  $^{15,18-23}$  In most instances, retention of configuration has been attributed to gross deviations in the intended mechanistic pathway involving  $S_N2'$  or  $S_N1$  processes during the Mitsunobu reaction of allylic alcohols  $^{15,18-20,23}$  or neighboring group participation.  $^{21,22}$  Neither of these situations exists in these systems. Lactonization under Mitsunobu conditions has been shown to occur generally with complete stereospecificity.  $^{17,21,24}$  In one instance, Fleming observed retention of configuration during generation of a five-membered lactone, but this result was attributed to formation of a carbocation intermediate,  $^{19}$  which again is not probable in these systems.

hindered alcohols such as 11, 14, and 17 can be attributed to preferential closure of an acyloxyphosphonium intermediate (e.g., 20, Scheme 6). Although the mechanism of the Mitsunobu reaction has been extensively studied, 13,14,25-27 we have recently demonstrated the intermediacy of acyloxyphosphonium salts in the Mitsunobu process.<sup>28</sup> The Mitsunobu reaction proceeds through an equilibrium (Scheme 6) of acyloxyphosphonium salt **20** and alkoxyphosphonium salt **21**. If the C-6 hydroxyl function is not sterically hindered (e.g., 8, Scheme 6), then carboxylate displacement from phosphonium salt **19** occurred with *inversion* of configuration to afford lactone 7b. On the other hand, if the hydroxyl moiety is highly hindered, e.g., 11, then carboxylate displacement cannot occur (21) and the competing lactonization with retention of configuration via acyloxyphosphonium salt 20 was observed.

Lactonization with retention of stereochemistry with

# Conclusion

The change in stereochemical outcome of the Mitsunobu reaction with highly hindered alcohol derivatives offers valuable insight into the mechanism of this important process, namely, that acyloxyphosphonium salt intermediates can play a critical role in the lactonization process. Additional studies relating to the generality of this process are underway and will be reported in due course.

# **Experimental Section**

**General Methods.** Nuclear magnetic resonance ( $^1$ H and  $^{13}$ C NMR) spectra were recorded on either a 200- or 400-MHz spectrometer in  $C_6D_6$  unless otherwise noted. Chemical shifts are reported in parts per million ( $\delta$ ) downfield from tetramethylsilane. Coupling constants (J values) are reported in hertz (Hz), and spin multiplicities are indicated by the following symbols: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet). Infrared spectra were recorded as solutions in CCl<sub>4</sub>. Band positions are given in reciprocal centimeters (cm $^{-1}$ ), and relative intensities are listed as br (broad), s (strong), m (medium), or w (weak). Thin-layer chromatography (TLC) was performed with the compounds being identified in one or more of the following manners: UV (254 nm), iodine, or vanillin/sulfuric acid charring. Melting points are corrected.

Tetrahydrofuran (THF) was distilled from sodium/benzophenone ketyl. Methanol (MeOH) was stored over molecular sieves. All reagents were distilled, recrystallized, or chromatographed prior to use unless otherwise noted. Glassware used in the reactions described below was dried for a minimum of 12 h in an oven at 120  $^{\circ}$ C and assembled under an atmosphere of nitrogen. The syntheses of compounds **3a**, **9**, **12**, and **15** have been previously reported.  $^{1,2,5}$ 

**Methoxy Bicyclic Lactone 7a.** A solution of *p*-TsOH (77.0 mg, 0.410 mmol) in 5 mL of MeOH was added to a solution of bicyclic lactone **3a** (760 mg, 4.07 mmol) in 5 mL of MeOH at 25 °C. After 30 min at 25 °C, the reaction was neutralized with 5% NaHCO<sub>3</sub> solution. The MeOH was evaporated in vacuo, and the remaining crude mixture was extracted with  $3 \times 30$  mL of EtOAc. The combined organic layers were washed with

10 mL of saturated NaCl and 10 mL of H2O, dried over Na2-SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/hexane) gave a 3:1 mixture of anomers of methoxy bicyclic lactone 7a (784 mg, 96%) as a white solid. The anomers were separated by chromatography, with only the major anomer 7a being used for subsequent chemistry. High  $R_f$  product (**7a-major**): mp 61–62 °C;  $R_f$  = 0.48, 50% EtOAc/hexane; IR (CCl<sub>4</sub>) 2987 (m), 2962 (m), 1743 (s), 1387 (s), 1212 (s), 1106 (s), 1075 (s); <sup>1</sup>H NMR ( $C_6D_6$ )  $\delta$  0.93 (d, 3H, J = 6.3), 1.13–1.30 (m, 1H), 1.25 (s, 3H), 1.63–1.74 (m, 1H), 2.24-2.44 (m, 2H), 2.77 (ddd, 1H, J = 15.9, 8.7, 6.7),3.04 (s, 3H), 3.50–3.66 (m, 1H), 4.02 (dt, 1H, J = 8.7, 8.0); <sup>13</sup>C NMR  $(C_6D_6)$   $\delta$  20.7, 20.8, 36.7, 41.1, 42.6, 48.3, 71.5, 73.4, 107.4, 172.4; LRMS (EI) 200 ((M<sup>+</sup>), 3), 185 (16), 169 (100), 112 (17), 109 (16); HRMS (EI) calcd for C<sub>10</sub>H<sub>16</sub>O<sub>4</sub> 200.1048 (M<sup>+</sup>), found 200.1063. Low  $R_f$  product (**7a-minor**): mp 98–100 °C;  $R_f = 0.38, 50\%$  EtOAc/hexane; IR (CCl<sub>4</sub>) 2987 (m), 2956 (m), 1743 (s), 1381 (s), 1212 (s), 1143 (s), 1068 (s); <sup>1</sup>H NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  0.95 (d, 3H, J = 6.3), 1.20 (s, 3H), 1.78–1.21 (m, 4H), 2.50– 2.61 (m, 1H), 2.98 (s, 3H), 3.43-3.56 (m, 1H), 4.10 (dt, 1H, J = 9.7, 8.0);  ${}^{13}$ C NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  20.8, 20.9, 38.4, 40.6, 42.4, 48.5, 70.5, 75.2, 108.2, 171.3; HRMS (EI) calcd for C<sub>9</sub>H<sub>13</sub>O<sub>3</sub> 169.0865  $((M^+) - OCH_3)$ , found 169.0862.

Methoxy Bicyclic Lactone 7b. A solution of NaOH (0.260 mL of 20% w/v, 1.30 mmol) was added to a solution of the methoxy bicyclic lactone 7a (217 mg, 1.10 mmol) in 2 mL of MeOH at 25 °C. After the addition was complete, the solution was heated at 70 °C for 1.5 h. The MeOH was evaporated in vacuo to provide a carboxylate. This crude salt was dissolved in 5 mL of THF, and 235 mg (1.30 mmol) of p-TsOH in 5 mL of THF was added. The reaction mixture of acid 8 was treated with a preformed solution of PPh<sub>3</sub> and DEAD (formed by addition of 228  $\mu$ L (1.30 mmol) of DEAD to a solution of 341 mg (1.30 mmol) of PPh3 in 5 mL of THF at 25 °C). After the mixture was stirred for 24 h at 25 °C, the reaction mixture was neutralized with 5% NaHCO3 solution and extracted with  $3 \times 50$  mL of EtOAc. The combined organic layers were washed with 10 mL of H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/hexane) gave 160 mg (74%) of methoxy bicyclic lactone 7b as an oil. No trace of diastereomeric lactone 7a was observed in either the  $^{1}\text{H}$  or  $^{13}\text{C}$  NMR spectrum of the product (<5%).  $R_f$  = 0.46, 50% EtOAc/hexane; IR (CCl<sub>4</sub>) 2985 (m), 2961 (m), 1748(s), 1382 (m), 1220 (s), 1186 (m), 1073 (m); <sup>1</sup>H NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  0.86 (d, 3H, J = 6.3), 1.19 (m, 1H), 1.24 (s, 3H), 1.58 (m, 1H), 2.36 (m, 2H), 2.64 (m, 1H), 3.04 (s, 3H), 3.41 (m, 1H), 3.94 (m, 1H); <sup>13</sup>C NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  20.7, 20.8, 36.7, 40.1, 46.5, 50.4, 69.9, 71.4, 104.8, 174.3. HRMS (EI) calcd for C<sub>10</sub>H<sub>16</sub>O<sub>4</sub> 200.1045 (M<sup>+</sup>), found 200.1063.

**Methoxy Bicyclic Lactone 10a.** A solution of *p*-TsOH (17.0 mg, 0.090 mmol) in 3 mL of MeOH was added to a solution of bicyclic lactone 9 (18.8 mg, 0.940 mmol) in 3 mL of MeOH at 25 °C. After 30 min at 25 °C, the reaction was neutralized with 5% NaHCO3 solution. The MeOH was evaporated in vacuo, and the remaining crude mixture was extracted with 3 × 10 mL of EtOAc. The combined organic layers were washed with 10 mL of saturated NaCl and 10 mL of H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/hexane) gave 139 mg (69%) of a 2:1 mixture of anomeric methoxy bicyclic lactone 10a as a colorless oil. The diastereomers were separated by chromatography, with only the major anomer **10a** being used for subsequent chemistry. High  $R_f$ product (**10a-major**):  $R_f = 0.69, 50\%$  EtOAc/hexane; IR (CCl<sub>4</sub>) 2986 (s), 2938 (s), 1746 (s), 1381 (s), 1209 (s), 1147 (s), 1026 (s); <sup>1</sup>H NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  0.66 (d, 3H, J = 6.7), 0.93 (d, 3H, J =6.3), 1.23 (s, 3H), 1.14-1.35 (m, 1H), 2.34 (m, 2H), 2.87 (m, 1H), 3.02 (s, 3H), 3.31 (m, 1H), 3.51 (t, 1H, J = 9.0); <sup>13</sup>C NMR  $(C_6D_6)\ \delta\ 14.6,\ 18.2,\ 20.5,\ 41.4,\ 41.6,\ 42.8,\ 48.2,\ 75.9,\ 80.4,\ 107.1,$ 172.1; LRMS (EI) 214 ((M+), 1), 183 (100), 182 (96), 165 (25), 137 (24), 136 (28), 107 (28); HRMS (EI) calcd for C<sub>11</sub>H<sub>18</sub>O<sub>4</sub> 214.1248 (M<sup>+</sup>), found 214.1248. Methoxy Bicyclic Lactone 10a Prepared by the Mitsunobu Reaction. A solution of NaOH (0.084 mL of 20% w/v, 0.42 mmol) was added to a solution of the methoxy bicyclic lactone **10a** (from above experimental) (60 mg, 0.28 mmol) in 5 mL of MeOH at 25 °C. After addition was completed, the solution was heated at 70 °C for 1.5 h. The MeOH was evaporated in vacuo to provide a carboxylate. This crude salt was dissolved in 5 mL of THF, and 61 mg (0.34 mmol) of p-TsOH in 5 mL of THF was added. The reaction mixture of acid 11 was treated with a preformed solution of PPh3 and DEAD (formed by addition of 69  $\mu$ L (0.28 mmol) of DEAD to a solution of 31 mg (0.28 mmol) of PPh3 in 5 mL of THF at 25 °C). After the mixture was stirred for 24 h at 25 °C, the reaction mixture was neutralized with 5% NaHCO<sub>3</sub> solution and extracted with  $3 \times 20$  mL of EtOAc. The combined organic layers were washed with 10 mL of H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/hexane) gave 99 mg (57%) of methoxy bicyclic lactone 10a as an oil. The product of the Mitsunobu reaction was identical by IR, 1H and 13C NMR spectroscopy to the spectra of the starting material, bicyclic lactone **10a**, described in the above experimental.

**Methoxy Bicyclic Lactone 13a.** A solution of *p*-TsOH (25.0 mg, 0.120 mmol) in 3 mL of MeOH was added to a solution of bicyclic lactone 12 (386 mg, 1.21 mmol) in 3 mL of MeOH at 25 °C. After 30 min at 25 °C, the reaction was neutralized with 5% NaHCO3 solution. The MeOH was evaporated in vacuo, and the remaining crude mixture was extracted with 3 × 20 mL of EtOAc. The combined organic layers were washed with 5 mL of saturated NaCl and 5 mL of H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/ hexane) gave 316 mg (79%) of a 2:1 mixture of anomeric methoxy bicyclic lactone 13a as a colorless oil. The diastereomers were separated by chromatography, with only the major anomer 13a being used for subsequent chemistry. High  $R_f$ product (**13a-major**):  $R_f = 0.67, 50\%$  EtOAc/hexane; IR (CCl<sub>4</sub>) 3031 (s), 2968 (s), 2937 (s), 1743 (s), 1493 (m), 1456 (s), 1381 (s), 1300 (s), 1212 (s), 1181 (s), 1075 (s);  ${}^{1}H$  NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  0.76

(d, 3H, J = 7.0), 1.24 (s, 3H), 1.37 (m, 1H), 1.91 (m, 2H), 2.38 (m, 2H), 2.65 (m, 1H), 3.04 (s, 3H), 3.24 (m, 2H), 3.82 (m, 1H), 3.97 (dt, 1H, J = 7.8, 8.9), 4.21 (d, 2H, J = 1.9), 7.08 - 7.24 (m, 5H);  ${}^{13}$ C NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  12.7, 20.7, 31.9, 37.8, 41.0, 43.0, 48.3, 71.2, 73.2, 73.6, 76.3, 107.5, 127.8, 128.3, 128.6, 139.3, 172.4; LRMS (EI) 303 ( $(M^+)$  – 31, 69), 173 (28), 160 (100), 159 (20), 145 (20), 127 (23), 113 (29), 105 (21); HRMS (EI) calcd for  $C_{19}H_{26}O_5$  303.1596 (M+), found 303.1613. Low  $R_f$  product (13a**minor**):  $R_f = 0.58$ , 50% EtOAc/hexane; IR (CCl<sub>4</sub>) 3031 (m), 2968 (s), 2908 (s), 1749 (s), 1497 (m), 1452 (s), 1378 (s), 1360 (s), 1200 (s); <sup>1</sup>H NMR ( $C_6D_6$ )  $\delta$  0.78 (d, 3H, J = 7.0), 1.16 (s, 3H), 1.38-1.65 (m, 2H), 1.79-2.01 (m, 2H), 2.42 (m, 1H), 2.98 (s, 3H), 3.11-3.32 (m, 2H), 3.73 (m, 1H), 4.02 (m, 2H), 4.19 (m, 2H), 7.03–7.24 (m, 5H);  ${}^{13}$ C NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  12.8, 20.9, 33.7, 37.9, 40.6, 42.8, 48.5, 71.3, 73.2, 75.5, 75.6, 108.2, 128.0, 128.2, 128.4, 139.1, 171.2.

Methoxy Bicyclic Lactone 13a Prepared by the Mitsunobu Reaction. A solution of NaOH (0.052 mL of 20% w/v, 0.26 mmol) was added to a solution of the major methoxy bicyclic lactone 13a (From above experimental) (86 mg, 0.26 mmol) in 2 mL of MeOH at 25 °C. After addition was complete, the solution was heated at 70 °C for 3 h. The MeOH was evaporated in vacuo to provide a carboxylate. This crude salt was dissolved in 5 mL of THF, and 54 mg (0.26 mmol) of p-TsOH in 5 mL of THF was added. The reaction mixture of acid 14 was treated with a preformed solution of PPh3 and DEAD (formed by addition of 45  $\mu$ L (0.26 mmol) of DEAD to a solution of 68 mg (0.26 mmol) of PPh3 in 3 mL of THF at 25 °C). After the mixture was stirred for 24 h at 25 °C, the reaction mixture was neutralized with 5% NaHCO<sub>3</sub> solution and extracted with  $3 \times 20$  mL of EtOAc. The combined organic layers were washed with 10 mL of H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/hexane) gave 31 mg (62%) of methoxy bicyclic lactone 13a as an oil. The product of the Mitsunobu reaction was identical by IR and <sup>1</sup>H and <sup>13</sup>C NMR spectroscopy to the spectra of the starting material, bicyclic lactone 13a, described in the above experimental.

**Methoxy Bicyclic Lactone 16a.** A solution of *p*-TsOH (4.0 mg, 0.019 mmol) in 2 mL of MeOH was added to a solution of bicyclic lactone  ${f 15}$  (63 mg, 0.19 mmol) in 2 mL of MeOH at 25 °C. After 30 min at 25 °C, the reaction was neutralized with 5% NaHCO<sub>3</sub> solution. The MeOH was evaporated in vacuo, and the remaining crude mixture was extracted with  $3 \times 20$ mL of EtOAc. The combined organic layers were washed with 5 mL of saturated NaCl and 5 mL of H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/hexane) gave 60 mg (92%) of a 2:1 mixture of anomeric methoxy bicyclic lactone 16a as a colorless oil. The anomers were separated by chromatography, with only the major anomer being used in subsequent chemistry. High  $R_f$  product (**16a-major**):  $R_f = 0.71$ , 50% EtOAc/ hexane; IR (CCl<sub>4</sub>) 3031 (m), 2970 (s), 2938 (s), 1749 (s), 1453 (s), 1380 (s), 1220 (s), 1187 (s), 1109 (s), 1068 (s); <sup>1</sup>H NMR  $(C_6D_6)$   $\delta$  0.69 (d, 3H, J = 7.0), 0.73 (d, 3H, J = 6.7), 1.22 (s, 3H), 1.61 (m, 1H), 1.86 (m, 1H), 2.32 (d, 2H, J = 8.7), 2.77 (q, 1H, J = 8.7), 3.00 (s, 3H), 3.17 (dd, 1H, J = 5.7, 8.7), 3.49 (m, 2H), 3.95 (dd, 1H, J = 1.9, 10.7), 4.30 (s, 2H), 7.17–7.31 (m, 5H);  $^{13}\text{C}$  NMR (C6D6)  $\delta$  8.6, 14.1, 20.4, 33.9, 37.6, 41.3, 42.9, 48.1, 72.1, 73.3, 77.9, 80.6, 107.1, 127.5, 127.8, 127.9, 139.1, 172.4; LRMS (EI) 317 ((M<sup>+</sup>) - 31, 99), 160 (88), 159 (51), 91 (100). Low  $R_f$  product (**16a-minor**):  $R_f = 0.60$ , 50% EtOAc/ hexane; IR (CCl<sub>4</sub>) 3033 (m), 2974 (s), 2939 (s), 1748 (s), 1456 (s), 1382 (s), 1220 (s), 1189 (s), 1143 (m), 1099 (s), 1019 (s); <sup>1</sup>H NMR (C<sub>6</sub>D<sub>6</sub>)  $\delta$  0.75 (d, 3H, J = 6.9), 0.79 (d, 3H, J = 6.7), 1.16 (s, 3H), 1.58 (m, 1H), 1.72–1.89 (m, 2H), 2.45 (m, 1H), 2.95 (s, 3H), 2.98 (m, 1H), 3.18 (dd, 1H, J = 5.7, 8.9), 3.52 (m, 2H), 3.91 (dd, 1H, J = 1.9, 10.7), 4.31 (d, 2H, J = 3.4), 7.09–7.32 (m, 5H);  $^{13}C$  NMR (C6D6)  $\delta$  8.8, 14.1, 20.7, 34.1, 38.4, 40.8, 42.8, 48.4, 72.1, 73.5, 77.0, 82.6, 107.9, 127.5, 127.8, 128.0, 140.4, 174.4; LRMS (EI) 317 ((M<sup>+</sup>) - 31, 100), 160 (44), 91 (99), 82

**Methoxy Bicyclic Lactone 16a Prepared from the Mitsunobu Reaction.** A solution of NaOH (0.054 mL of 20% w/v, 0.27 mmol) was added to a solution of the major methoxy

bicyclic lactone 16a (from the above experiment) (93 mg, 0.27 mmol) in 2 mL of MeOH at 25 °C. After addition was complete, the solution was heated at 70 °C for 1.5 h. The MeOH was evaporated in vacuo to provide a carboxylate. This crude salt was dissolved in 5 mL of THF, and 55 mg (0.26 mmol) of p-TsOH in 5 mL of THF was added. The reaction mixture of acid 17 was treated with a preformed solution of PPh3 and DEAD (formed by addition of 47  $\mu$ L (0.26 mmol) of DEAD to a solution of 70 mg (0.26 mmol) of PPh3 in 5 mL of THF at 25 °C). After the mixture was stirred for 24 h at 25 °C, the reaction mixture was neutralized with 5% NaHCO3 solution and extracted with 3  $\times$  30 mL of EtOAc. The combined organic layers were washed with 10 mL of H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. Purification of the residue by flash chromatography (50% EtOAc/hexane) gave 70 mg (75%) of methoxy bicyclic lactone 16a as an oil. The product of the Mitsunobu reaction was identical by IR and <sup>1</sup>H and <sup>13</sup>C NMR spectroscopy to the spectra of the starting material, bicyclic lactone 16a, described in the above paragraph.

**Acknowledgment.** We thank Dr. David Simpson, Reuben Correia, and Amy Manoso for helpful suggestions. We also thank Dr. Yiu-Fai Lam and Ms. Caroline Ladd for their assistance in obtaining NMR and mass spectral data. The financial support of the University of Maryland, National Institutes of Health (CA-82169) and the KCS-KOSEF Research Fund (KCS-KOSEF-1999-04) is acknowledged.
